#### Accuracy, Detail, and Guessing

I use the word speculation for this type of analysis. The definition being "the forming of a theory or conjecture without firm evidence." (Oxford Dictionaries, 2012) Speculation differs from guessing, which does not form any kind of framework for thinking about the problem. We were unsure who would invest. how much, or what industry may visualize an opportunity in this specific geography next to Boeing. Therefore, our analysis focused on the current economic industry matrix (1) which surrounds this piece of undeveloped property. IM-PLAN provided much of these data. We triangulated three methods of analysis: Enterprise Network Systems (ENS), the discovery of what industry is not present that could be with Boeing's ability to provide a market for their goods and services; business-to-business indirect transactions, including regional imports; and association analysis comparing geography of industry location of Charleston Metropolitan Statistical Area (MSA) and King County Washington, home to significant Boeing operations. The temptation is to pile on mountains of detail but, unfortunately, a mound of detail does not make the analysis any more accurate. With these data, we balanced the need for detail with the accuracy of the method to recommend one type of industry as more likely than another (as opposed to one chosen at random).

#### Enterprise Network Systems

ENS is the analysis of industry (2) that is "not present," but could be under the right set of circumstances as a result of either available commodities (3) to

produce products or customer to supply we have a new custook this analysis one PLAN and asked the modities does Boeing We focused on IM-Source for the data in

the presence of a new products to. In this case tomer, Boeing! We then step further with IMquestion, "What comneed that are not here?" PLAN 284 Aircraft Mfg. IMPLAN 3.0 was IM-

PLAN 3.0, Social Accounts Explorer, Balance Sheet, and Commodity Demand. (Use table)(4). We were interested in Regional Absorption (5) (low) and Rezional Purchase Coefficient (RPC)(4) (low) and "not present." High numerical values in the first two categories did not suggest those industries would not further expand -- either from within or outside the region -- to meet new demand, but for ENS we focused primarily on those not present or those with a small presence relative to Boeing's needs. See Table 1. This analysis did not take into account whether commodities were available to those new businesses. that would supply Boeing, the next iteration. Finally, we compared the IM-PLAN table of companies to the Bureau of Economic Analysis (BEA) Aircraft Mfg. Use table. The comparison from the top 25 industries of interest yielded: other/aircraft engine, carpet, watch clock, fluid power, search detection, adhesive (7), semiconductors (8), plastics, plumbing, and wiring device manufacturing. ## New Industry Analysis: IMPLAN Social Accounts

## Current Knowledge

As a result of an earlier Boeing impact (we did not have to run a separate impact). before Boeing chose Charleston, we knew which industries were present to support a new Boeing assembly plant. In particular, Vought Aircraft and Alenia Aeronautica, both major manufacturers. However, what we did not know was that first impact provided valuable information about indirect impacts and imported indirect commodities that Boeing might use to the build the 787 Dreamliner (787).

#### Rural Developments

We would not recommend this analysis for small clear "field" developments in rural America since the analysis needs an industry base to build from. Instead, considerations might include natural resources (including utilities), visitor opportunities, and larger geographies (multi county) to develop opportunities for rural geographies.

## Regional Imports

Regional analysis of imports allowed us to evaluate what industries may choose to locate or expand based on a significant increase in a local industry (Boeing boasts 5,000+ employees). Our geography is micro in size, therefore "It is generally true that the smaller the economic area, the more dependent that area's economy is on trade with 'outside areas'." (Miller, 2009) In this case, size counts, so we evaluated the region as

a whole. Two industries already in the geography are motor vehicle parts manufacturing and, surprisingly, food services

and drinking places. Food Services is a significant industry in the Charleston MSA, generating a substantial import market. Also included are wholesale trade, based on location to existing infrastructure (freeway/airport), and specialized design services (engineering), a result of the presence of aircraft and automotive industries.

Regional

| Industry Selection |  |
|--------------------|--|

Based on our method, we selected the final industries for inclusion in an IMPLAN run, which included evaluating the multipliers. We did not want significant variance from a generic portfolio of industries. If such variance existed, we wanted to know why. Our multiplier average was slightly higher than our "generic industry mix" as a result of a higher than average food service multiplier; reasonable, given the characteristics of the region. Prior to running IMPLAN, we were provided with the square footage of the different types of development including light manufacturing and office space. Based on those data, we estimated employment based on employees per square foot for each

type of industry from national averages. We then separately estimated construction costs and impacts using Means Construction estimates on a per foot basis. RUN IMPLAN

## End Notes

- 1) Here we are referring to the Use matrix as "a square with the labels of industries and commodities identical" (Miller, 2009).
- 2) Industries consist of businesses' products, goods, and services.
- 3) Commodities are goods and services.
- 4) The Use table details the dollar value of goods and services purchased by each industry to use in their production process. A column is a single industry, the rows are the commodities, and the units are dollars.
- 5) The Absorption table is a coefficient form of the Use table derived by dividing each element of the Use table by respective industry's total dollar output. An industry will use a number of commodities to produce its products. The Absorption table shows the proportions of each commodity it uses. Each column is an industry's production function. A production function shows the proportions of commodities used to produce one dollar of output.
- 6) The RPC represents the proportion of local demand purchased from local producers.
- 7) Charleston has a history of adhesive manufacturing.
- 8) NOT Likely.
